PRD-07 · Settings, AI providers, privacy, storage and updates

Status: Shipped (v0.1.2) · **Updated:** 2026-10-30 · **Design:** DD-01 AI brain, DD-07 Storage, DD-08 Release and updates

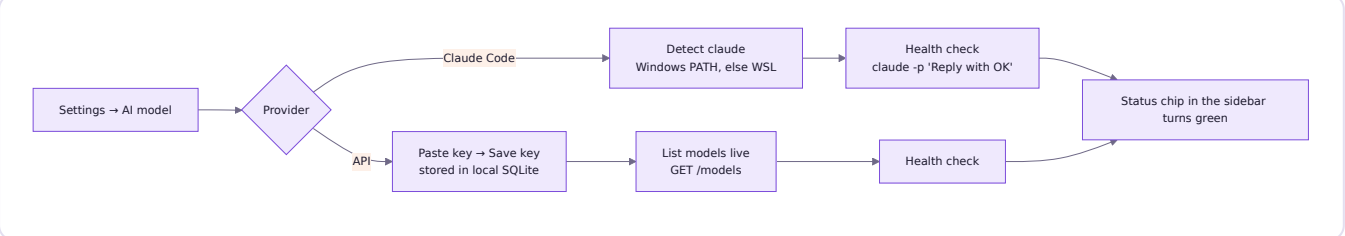

1. Summary

Onsite is shared with friends who have different setups. Settings lets each person **bring their own AI**, tune voice, pick a look, see exactly what happens to their data, control disk use, and update the app. Settings is one screen with six sections: **Appearance · AI model · VoiceStudio · Updates · Privacy · Storage**.

2. Bring your own AI

Provider	What the user needs	Cost	Default interviewer / feedback model
Claude Code	Claude Pro or Max, Claude Code installed (Windows or WSL)	Included in the subscription	`sonnet` / `opus`
Claude API	An Anthropic API key	Pay per use	claude-sonnet-5-5 / claude-opus-5-5
OpenAI	An OpenAI API key	Pay per use (separate from ChatGPT Plus)	gpt-5.5
Gemini	A free Google AI key	Free tier with daily limits (Flash models)	gemini-flash-latest
Groq	A free Groq key	Free tier, ~8K tokens/minute	qwen/qwen3.8-27b / openai/gpt-oss-120b

Two model choices per provider: the **interviewer model** (fast, live) and the **feedback, verdict and research model** (stronger, slower). Model lists are fetched live from each provider, because ids change fast.

Requirements

Id	Requirement	Status
SET-R1	A provider without a key shows "Add your key in Settings first." on any AI action.	Shipped
SET-R2	Keys are never sent back to the UI (the UI only learns *which* providers have a key) and never logged.	Shipped
SET-R3	Claude Code path is auto-detected once and re-detected if the saved .exe disappears. A path can be set by hand.	Shipped
SET-R4	The health check shows the result, the latency and which path or API was used.	Shipped
SET-R5	Free-tier rate limits (HTTP 429) are waited out: up to 60 s per wait, 90 s in total.	Shipped
SET-R6	Groq models that run tools on their own (`groq/compound*`) are hidden from the pickers.	Shipped
SET-R7	Claude API, OpenAI and Gemini are verified against a live key with a short round per provider.	**Open:** only Claude Code and Groq have run live so far

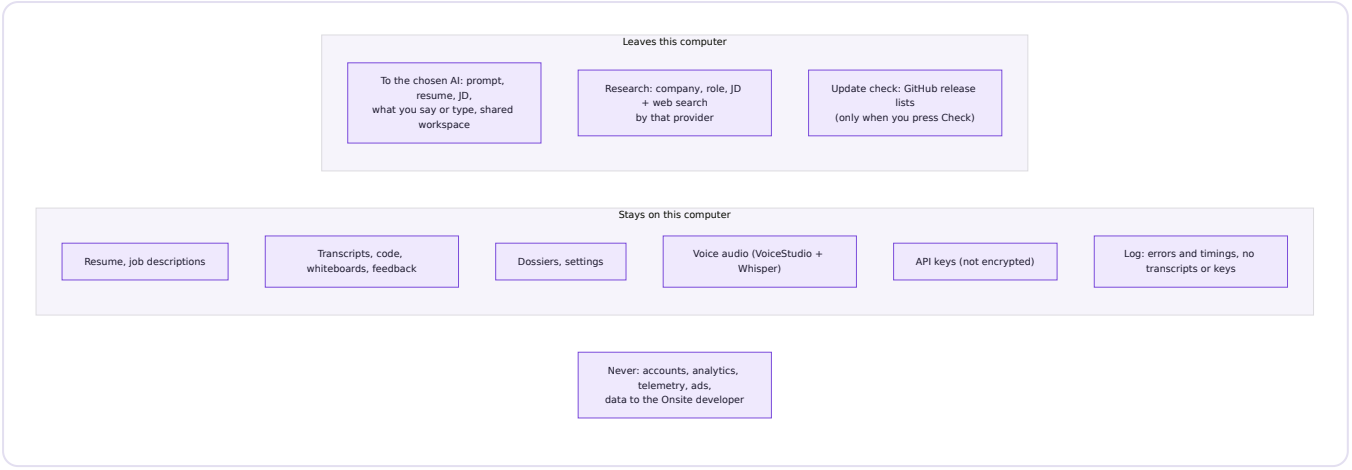

3. Appearance

Setting	Options
Theme	Onsite (default), Nord, Rosé Pine, Gruvbox
Mode	System (follows the OS), Light, Dark
Background image	The theme's picture, your own image (shrunk to ≤ 2560×1600, saved locally), or none; optional dim

The whiteboard stays dark in every theme. Details in UI design.

4. Privacy

The Privacy section states, in plain words, what Onsite does with data. The text lives in `ui/index.html` and must be kept true whenever a data flow changes.

Id	Requirement	Status
PRIV-R1	No telemetry, analytics or accounts, ever.	Shipped
PRIV-R2	The Privacy section lists every outbound flow. A new flow is not merged until this text and `PRIVACY.md` are updated.	Shipped (rule)
PRIV-R3	The privacy text admits API keys are not encrypted and tells the user how to remove them.	Shipped
PRIV-R4	Uninstalling leaves the data folder; Storage → Open data folder lets the user delete everything.	Shipped

5. Storage

Control	Options	Effect
Keep at most	All · 500 · 200 · 100 · 50 · 20 rounds	Oldest finished rounds deleted, with transcript and feedback
Delete rounds older than	Never · 1 year · 6 months · 3 months · 1 month	Same
Clear the log above	5 · 20 · 50 · 100 MB	Log truncated at startup when over
Clean up	Clear the log · Delete temporary files · Compact the database	One-off actions
Open	Data folder · Log folder	Opens in the file manager

Limits apply when saved and at every startup. Rounds still running are never touched.

6. Updates

Id	Requirement	Status
UPD-R1	Onsite checks GitHub releases **only when the user presses Check for updates**.	Shipped
UPD-R2	"All versions" lists every release; any one can be installed, including older ones. An older version may not read newer data (warned).	Shipped
UPD-R3	Windows: download the setup .exe, run it, quit. macOS: open the dmg. Linux AppImage: replace itself and restart. Linux .deb: save to Downloads.	Shipped
UPD-R4	Installing is refused while a round or a research job is running.	Shipped
UPD-R5	Downloads only from `github.com` URLs of the Onsite repo. Draft releases are skipped.	Shipped
UPD-R6	VoiceStudio: show installed and newest version. Never update it.	Shipped
UPD-R7	Signed Windows installer via SignPath Foundation.	**Pending:** application submitted 2026-10; releases are unsigned until approved

7. Sidebar status chips

Two chips at the bottom of the sidebar show at a glance whether the app can run a round:

Chip	Green when	Click goes to
AI model (shows the provider)	The provider is configured: Claude Code found, or a key saved	Settings → AI model
VoiceStudio	Running with its voice model loaded. Amber while loading, red when not running.	Settings → VoiceStudio

The chips refresh every 15 s, except during a round.
